

Predicate Logic

Predicate Logic

- **Propositional Logic**

- Allows us to analyze complex propositions in terms of their simpler constituent parts (a.k.a. atomic propositions) joined by connectives

- **Predicate Logic**

- Lets us analyze them at a deeper level by expressing how those propositions depend on the objects they are talking about

“All positive integers x , y , and z satisfy $x^3 + y^3 \neq z^3$.”

Predicate Logic

Adds two key notions to propositional logic

- Predicates**

- Quantifiers**

Predicates

Predicate

– A function that returns a truth value, e.g.,

$\text{Cat}(x) ::= \text{"x is a cat"}$

$\text{Prime}(x) ::= \text{"x is prime"}$

$\text{HasTaken}(x, y) ::= \text{"student x has taken course y"}$

$\text{LessThan}(x, y) ::= \text{"x < y"}$

$\text{Sum}(x, y, z) ::= \text{"x + y = z"}$

$\text{GreaterThan5}(x) ::= \text{"x > 5"}$

$\text{HasNChars}(s, n) ::= \text{"string s has length n"}$

Predicates can have varying numbers of arguments and input types.

Domain of Discourse

For ease of use, we define one “type”/“domain” that we work over. This non-empty set of objects is called the **“domain of discourse”**.

For each of the following, what might the domain be?

(1) “x is a cat”, “x barks”, “x ruined my couch”

“mammals” or “sentient beings” or “cats and dogs” or ...

(2) “x is prime”, “ $x = 0$ ”, “ $x < 0$ ”, “x is a power of two”

“numbers” or “integers” or “integers greater than 5” or ...

(3) “student x has taken course y” “x is a pre-req for z”

“students and courses” or “university entities” or ...

Quantifiers

We use *quantifiers* to talk about collections of objects.

$$\forall x P(x)$$

$P(x)$ is true **for every** x in the domain

read as “**for all** x , P of x ”

$$\exists x P(x)$$

There is an x in the domain for which $P(x)$ is true

read as “**there exists** x , P of x ”

Statements with Quantifiers

Domain of Discourse

Positive Integers

Predicate Definitions

Even(x) ::= "x is even" Greater(x, y) ::= "x > y"

Odd(x) ::= "x is odd" Equal(x, y) ::= "x = y"

Prime(x) ::= "x is prime" Sum(x, y, z) ::= "x + y = z"

Determine the truth values of each of these statements:

$\exists x \text{ Even}(x)$ **T** e.g. 2, 4, 6, ...

$\forall x \text{ Odd}(x)$ **F** e.g. 2, 4, 6, ...

$\forall x (\text{Even}(x) \vee \text{Odd}(x))$ **T** every integer is either even or odd

$\exists x (\text{Even}(x) \wedge \text{Odd}(x))$ **F** no integer is both even and odd

$\forall x \text{ Greater}(x+1, x)$ **T** adding 1 makes a bigger number

$\exists x (\text{Even}(x) \wedge \text{Prime}(x))$ **T** Even(2) is true and Prime(2) is true

Statements with Quantifiers (Literal Translations)

Domain of Discourse

Positive Integers

Predicate Definitions

Even(x) ::= "x is even" Greater(x, y) ::= "x > y"

Odd(x) ::= "x is odd" Equal(x, y) ::= "x = y"

Prime(x) ::= "x is prime" Sum(x, y, z) ::= "x + y = z"

Translate the following statements to English

$\forall x \exists y \text{ Greater}(y, x)$

For every positive integer x, there is a positive integer y, such that $y > x$.

$\exists y \forall x \text{ Greater}(y, x)$

There is a positive integer y such that, for every pos. int. x, we have $y > x$.

$\forall x \exists y (\text{Greater}(y, x) \wedge \text{Prime}(y))$

For every positive integer x, there is a pos. int. y such that $y > x$ and y is prime.

$\forall x (\text{Prime}(x) \rightarrow (\text{Equal}(x, 2) \vee \text{Odd}(x)))$

For each positive integer x, if x is prime, then $x = 2$ or x is odd.

$\exists x \exists y (\text{Sum}(x, 2, y) \wedge \text{Prime}(x) \wedge \text{Prime}(y))$

There exist positive integers x and y such that $x + 2 = y$ and x and y are prime.

Statements with Quantifiers (Literal Translations)

Domain of Discourse

Positive Integers

Predicate Definitions

Even(x) ::= "x is even" Greater(x, y) ::= "x > y"

Odd(x) ::= "x is odd" Equal(x, y) ::= "x = y"

Prime(x) ::= "x is prime" Sum(x, y, z) ::= "x + y = z"

Translate the following statements to English

$\forall x \exists y \text{ Greater}(y, x)$

For every positive integer x, there is a positive integer y, such that $y > x$.

$\exists y \forall x \text{ Greater}(y, x)$

There is a positive integer y such that, for every pos. int. x, we have $y > x$.

$\forall x \exists y (\text{Greater}(y, x) \wedge \text{Prime}(y))$

For every positive integer x, there is a pos. int. y such that $y > x$ and y is prime.

Statements with Quantifiers (Natural Translations)

Domain of Discourse

Positive Integers

Predicate Definitions

Even(x) ::= "x is even" Greater(x, y) ::= "x > y"

Odd(x) ::= "x is odd" Equal(x, y) ::= "x = y"

Prime(x) ::= "x is prime" Sum(x, y, z) ::= "x + y = z"

Translate the following statements to English

$\forall x \exists y \text{ Greater}(y, x)$

For every positive integer, there is some larger positive integer.

$\exists y \forall x \text{ Greater}(y, x)$

There is a positive integer that is larger than every other positive integer.

$\forall x \exists y (\text{Greater}(y, x) \wedge \text{Prime}(y))$

For every positive integer, there is a prime that is larger.

Sound more natural without introducing variable names

English to Predicate Logic

Domain of Discourse

Mammals

Predicate Definitions

Cat(x) ::= "x is a cat"

Red(x) ::= "x is red"

LikesTofu(x) ::= "x likes tofu"

"All red cats like tofu"

$\forall x ((\text{Red}(x) \wedge \text{Cat}(x)) \rightarrow \text{LikesTofu}(x))$

"Some red cats don't like tofu"

$\exists y ((\text{Red}(y) \wedge \text{Cat}(y)) \wedge \neg \text{LikesTofu}(y))$

English to Predicate Logic

Domain of Discourse

Mammals

Predicate Definitions

$\text{Cat}(x) ::= \text{"x is a cat"}$

$\text{Red}(x) ::= \text{"x is red"}$

$\text{LikesTofu}(x) ::= \text{"x likes tofu"}$

When putting two predicates together like this, we use an "and".

"All Red cats like tofu"

When restricting to a smaller domain in a "for all" we use **implication**.

"Some red cats don't like tofu"

When restricting to a smaller domain in an "exists" we use **and**.

"Some" means "there exists".

Statements with Quantifiers (Literal Translations)

Domain of Discourse

Positive Integers

Predicate Definitions

Even(x) ::= "x is even" Greater(x, y) ::= "x > y"

Odd(x) ::= "x is odd" Equal(x, y) ::= "x = y"

Prime(x) ::= "x is prime" Sum(x, y, z) ::= "x + y = z"

Translate the following statements to English

$\forall x (\text{Prime}(x) \rightarrow (\text{Equal}(x, 2) \vee \text{Odd}(x)))$

For each positive integer x, if x is prime, then x = 2 or x is odd.

$\exists x \exists y (\text{Sum}(x, 2, y) \wedge \text{Prime}(x) \wedge \text{Prime}(y))$

There exist positive integers x and y such that x + 2 = y and x and y are prime.

Statements with Quantifiers (Literal Translations)

Domain of Discourse

Positive Integers

Predicate Definitions

Even(x) ::= "x is even"

Greater(x, y) ::= "x > y"

Odd(x) ::= "x is odd"

Equal(x, y) ::= "x = y"

Prime(x) ::= "x is prime"

Sum(x, y, z) ::= "x + y = z"

Translate the following statements to English

$\forall x (\text{Prime}(x) \rightarrow (\text{Equal}(x, 2) \vee \text{Odd}(x)))$

Every prime number is either 2 or odd.

$\exists x \exists y (\text{Sum}(x, 2, y) \wedge \text{Prime}(x) \wedge \text{Prime}(y))$

There exist prime numbers that differ by two.

Spot the domain restriction patterns

English to Predicate Logic

Domain of Discourse

Mammals

Predicate Definitions

$\text{Cat}(x) ::= \text{"x is a cat"}$

$\text{Red}(x) ::= \text{"x is red"}$

$\text{LikesTofu}(x) ::= \text{"x likes tofu"}$

All Red cats like tofu

Red cats like tofu

When there's no leading
quantification, it means "for all".

Some red cats don't like tofu

A red cat doesn't like tofu

"A" means "there exists".

Statements with Quantifiers (Natural Translations)

Translations often (not always) sound more natural if we

1. Notice “domain restriction” patterns

$$\forall x (\text{Prime}(x) \rightarrow (\text{Equal}(x, 2) \vee \text{Odd}(x)))$$

Every prime number is either 2 or odd.

2. Avoid introducing *unnecessary* variable names

$$\forall x \exists y \text{ Greater}(y, x)$$

For every positive integer, there is some larger positive integer.

3. Can sometimes drop “all” or “there is”

$$\neg \exists x (\text{Even}(x) \wedge \text{Prime}(x) \wedge \text{Greater}(x, 2))$$

No even prime is greater than 2.

More English Ambiguity

Implicit quantifiers in English are often **confusing**

Three people that are all friends can form a raiding party \forall

Three people I know are all friends with Mark Zuckerberg \exists

Formal logic removes this ambiguity

- quantifiers can always be specified
- unquantified variables that are not known constants (e.g, π) are **implicitly** \forall -quantified

Negations of Quantifiers

Predicate Definitions

$\text{PurpleFruit}(x) ::= \text{"x is a purple fruit"}$

(*) $\forall x \text{ PurpleFruit}(x)$ ("All fruits are purple")

What is the negation of (*)?

- (a) "there exists a purple fruit"
- (b) "there exists a non-purple fruit"
- (c) "all fruits are not purple"

Try your intuition! Which one seems right?

Negations of Quantifiers

Predicate Definitions

$\text{PurpleFruit}(x) ::= \text{"x is a purple fruit"}$

(*) $\forall x \text{ PurpleFruit}(x)$ ("All fruits are purple")

What is the negation of (*)?

- (a) "there exists a purple fruit"
- (b) "there exists a non-purple fruit"
- (c) "all fruits are not purple"

Domain of Discourse

{plum, apple}

(*) $\text{PurpleFruit}(\text{plum}) \wedge \text{PurpleFruit}(\text{apple})$

- (a) $\text{PurpleFruit}(\text{plum}) \vee \text{PurpleFruit}(\text{apple})$
- (b) $\neg \text{PurpleFruit}(\text{plum}) \vee \neg \text{PurpleFruit}(\text{apple})$
- (c) $\neg \text{PurpleFruit}(\text{plum}) \wedge \neg \text{PurpleFruit}(\text{apple})$

Scope of Quantifiers

$$\exists x (P(x) \wedge Q(x)) \quad \text{vs.} \quad \exists x P(x) \wedge \exists x Q(x)$$

Scope of Quantifiers

$$\exists x (P(x) \wedge Q(x)) \quad \text{vs.} \quad \exists x P(x) \wedge \exists x Q(x)$$

This one asserts P
and Q of the *same* x.

This one asserts P and Q
of potentially different x's.

*Variables with the same name do not
necessarily refer to the same object.*

Scope of Quantifiers

Domain of Discourse
{1, 2, 3, 4}

Example: $\text{NotLargest}(x) ::= \exists y \text{ Greater}(y, x)$
 $\equiv \exists z \text{ Greater}(z, x)$

truth value:

doesn't depend on y or z “**bound** variables”

does depend on x “**free** variable”

quantifiers only act on free variables of the formula
they quantify

$$\exists y (P(x, y) \rightarrow \forall x Q(y, x))$$

Scope of Quantifiers

Domain of Discourse
{1, 2, 3, 4}

Example: $\text{NotLargest}(x) ::= \exists y \text{ Greater}(y, x)$
 $\equiv \exists z \text{ Greater}(z, x)$

truth value:

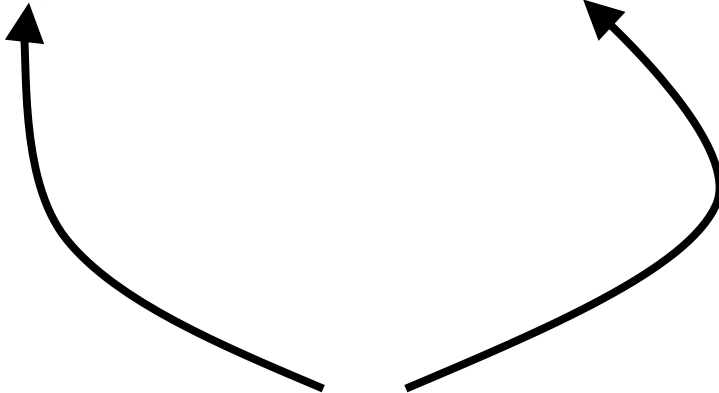

doesn't depend on y or z “**bound** variables”

does depend on x “**free** variable”

quantifiers only act on free variables of the formula
they quantify

$$\forall x (\exists y (P(x, y) \rightarrow \forall x Q(y, x)))$$

Quantifier “Style”

$$\forall x (\exists y (P(x, y) \rightarrow \forall x Q(y, x)))$$

This isn't “wrong”, it's just horrible style.
Don't confuse your reader by using the same
variable multiple times...there are a lot of letters...

Nested Quantifiers

- **Bound variable names don't matter**

$$\forall x \exists y P(x, y) \equiv \forall a \exists b P(a, b)$$

- **Positions of quantifiers can sometimes change**

$$\forall x (Q(x) \wedge \exists y P(x, y)) \equiv \forall x \exists y (Q(x) \wedge P(x, y))$$

- **But: **order is important...****

Quantifier Order Can Matter

Domain of Discourse

{1, 2, 3, 4}

Predicate Definitions

GreaterEq(x, y) ::= "x ≥ y"

"There is a number greater than or equal to all numbers."

$\exists x \forall y \text{ GreaterEq}(x, y)$

		y			
		1	2	3	4
x	1	T	F	F	F
	2	T	T	F	F
	3	T	T	T	F
	4	T	T	T	T

Quantifier Order Can Matter

Domain of Discourse

{1, 2, 3, 4}

Predicate Definitions

GreaterEq(x, y) ::= "x ≥ y"

“There is a number greater than or equal to all numbers.”

$\exists x \forall y \text{ GreaterEq}(x, y)$

“Every number has a number greater than or equal to it.”

$\forall y \exists x \text{ GreaterEq}(x, y)$

y

	1	2	3	4
1	T	F	F	F
2	T	T	F	F
3	T	T	T	F
4	T	T	T	T

x

Quantifier Order Can Matter

Domain of Discourse

{1, 2, 3, 4}

Predicate Definitions

GreaterEq(x, y) ::= "x ≥ y"

“There is a number greater than or equal to all numbers.”

$\exists x \forall y \text{ GreaterEq}(x, y)$

“Every number has a number greater than or equal to it.”

$\forall y \exists x \text{ GreaterEq}(x, y)$

	1	2	3	4
1	T	F	F	F
2	T	T	F	F
3	T	T	T	F
4	T	T	T	T

The purple statement requires an **entire row** to be true.

The red statement requires one entry in **each column** to be true.

Important: both include the case $x = y$

Different names does not imply different objects!

Quantification with Two Variables

expression	when true	when false
$\forall x \forall y P(x, y)$	Every pair is true.	At least one pair is false.
$\exists x \exists y P(x, y)$	At least one pair is true.	All pairs are false.
$\forall x \exists y P(x, y)$	We can find a specific y for each x. $(x_1, y_1), (x_2, y_2), (x_3, y_3)$	Some x doesn't have a corresponding y.
$\exists y \forall x P(x, y)$	We can find ONE y that works no matter what x is. $(x_1, y), (x_2, y), (x_3, y)$	For any candidate y, there is an x that it doesn't work for.
